Wie E ditu it 53 T.all 53-51 Itam 1 from file: 155 DIALCA, R, File 188:METLINE, R, 13286670 21645164 FMIE: 117g7878 Dual binding capabilities of anti-double-stranded INA antibodies and anti-ribos mal phosphoprotein I antibodies . Tákeda I; Bayno K; Movaragh F B; Wb.:scn-Reishlin M; Reishlin N Arthritis and Immunology Fragram, Sklahuma Medical Research Fundation, Oxlab ma Thirersity Health 3 dendes Center, Chlabina Ciry, UUA. Lupus (England | 15-1, 1 | 12 | 1-17-41, 10:11-961-, 13 Tourhail Mad: No 41.50 Contract/Grant No.: R91 AR4390%; AR; NIAMO Document type: Journal Article Languages: ENGLISH Main Citation Gwner: NLM Record type: Completed The aim of this study is to identify distinctive properties of pathogenic anti-double stranded INA antibodies and anti-ribosomal P antibodies . The binding activity of anti-dsDNA and anti-ribosomal P antibodies — to their cognate antigens in 0.15 M and 1.5 M NeOl solutions on ELISA was examined. All anti-mDNA and anti-riboscmal i entitodies exhibited a loss of their minuing activity or m 37.5 to 100 and from 2.3 to 97.4 if high ionic strength suffers, respectively. In Matrast, anti-MIRMP antibodies and anti-Rouss anti-Modies let in moto si.7 and from 0 to 40.1. of their binding activity, respectively. Anti-dsDNA and anti-ribosomal F antibodies from patients with maphropring showed significantly higher binding activity in high ionic strength buffers than those from patients without hephropathy. Study if paired sera from lupus nephritis patients revealed that anti-dsDNA and anti-riboscmal P antibodies from patients during disease tlare show stronger binding activity in high ionic strength buffer than those during remission. Most anti-dsPCA and anti-ribosomal I antibodies bind their antigens by ionic interactions that are sensitive to high salt. Such dual Binding dapability or anti-dsDNA and anti-ribuschal F antib dies may underlie their multiply pross reactivities to various epitopes, and help eluciate the pathogenia potential of autoants cap subsets.
